In the Abstract (clean copy as amended)

A method for isomerizing aromatic compounds, wherein at least one aromatic compound is contacted with a zeolite-containing catalyst, and in which the zeolite is characterized in that:

- (1) the minimum value of the pore aperture diameter of the major channels therein is larger than 0.65 nanometers, or the maximum value thereof is larger than 0.70 nanometers, and
- (2) the major channels do not intersect any others with larger apertures than oxygen 10-membered ring;

and the aromatic compounds are at least one selected from;

- (a) aromatic compounds having at least three substituents,
- (b) aromatic compounds having two substituents of which at least one is a halogen or has at least 2 carbon atoms, and
- (c) naphthalene or anthracene derivatives having substituent(s), wherein aromatic compounds having a relatively large molecular size can be efficiently isomerized.
